LAFIYACONNECT: UI/UX DESIGN CASE STUDY

Final Capstone Project Report Author: Nusaiba Ado Kabir Track: UI/UX Design Internship (Skill Set Go EduTech)

1. Executive Summary & Problem Statement

LafiyaConnect is a patient-centric, hematology-focused mobile application designed to streamline blood test bookings, laboratory result tracking, and health education management. In many healthcare environments, communication barriers and complex booking systems create friction for patients. LafiyaConnect addresses this by integrating real-time multilingual accessibility (English, Nigerian Pidgin, and Hausa) to ensure seamless user adoption across diverse demographics.

2. Research & Ideation (Weeks 1 & 2)

Target Users: Patients requiring regular blood/hematology diagnostics, elderly users, and caregivers managing health

records.

Core Pain Points: Complex hospital queues, lack of localized language support in health apps, and confusing test result navigation.

User Journey & Information Architecture: Mapped clear, friction-free paths from initial onboarding and language selection to dashboard navigation, test selection, and secure result retrieval.

Wireframing: Progressed from low-fidelity paper/digital wireframes to structured high-fidelity layouts focusing on thumb-friendly mobile ergonomics (375px-414px viewports).

3. Design System & UI Components (Week 3)

To ensure visual consistency and a calming, professional medical identity, the following design tokens and components were established:

Color Palette:

Primary Brand Color (Deep Burgundy / Maroon): Used for primary headers, brand identity, and key interactive actions.

Secondary Accent (Soft Pink / Dusty Rose): Applied to form input backgrounds and subtle selection containers.

Neutral Dark (Dark Navy): Designated for high-readability text and headings.

Typography Hierarchy: Clean, scalable font weights adhering to an 8pt grid system for perfect alignment and spacing.

Core Components: Bento-style dashboard cards, accessible form fields, and an interactive multilingual switcher component.

4. High-Fidelity Prototyping & Testing (Week 4)

Interactive Prototype: Developed a fully clickable high-fidelity prototype in Figma demonstrating smooth

transitions, real-time language toggles, and valid form states. Usability & Accessibility: Ensured a minimum touch target size of 48x48px and high color contrast ratios for optimal accessibility across all user groups.

5. External Certifications & Professional Development

In parallel with the core UI/UX design tracks, the following external credentials were completed and documented:

Forage: Lloyds Banking Group UX Design Introduction
IBM SkillsBuild: UX Design / Design Thinking Credential
Infosys Springboard: UI/UX Design Certification
HP LIFE: Design Thinking Certificate of Completion
