

SKILL SET GO UI/UX DESIGN INTERNSHIP

Week 1 Submission: LafiyaConnect (Hematology Unit Focus)

Name :Kabir Nusaiba Ado

Internship Track:UI/UX Design (4-Week Practical Learning Track)

Project Name:LafiyaConnect

Project Focus: A mobile healthcare application concept specialized in the “hematology unit”, featuring multilingual accessibility (English, Nigerian Pidgin, and Hausa) for seamless blood test bookings, genotype/full blood count results, and transfusion tracking.

1. UX Principles & Visual Foundations

Human-Centered Hematology Workflow: Designed to reduce patient anxiety around critical blood work (e.g., genotype tests, packed cell volume, and full blood counts) by simplifying test selection and result interpretation.

Multilingual Medical Accessibility: Implemented real-time language toggling (English, Hausa, and Nigerian Pidgin) to ensure patients and older relatives clearly understand hematological lab instructions, fasting requirements, and collection steps.

Visual Hierarchy & Clarity: Utilized a clean, trustworthy clinical color palette, high-contrast typography, and intuitive spacing to clearly delineate sensitive lab metrics (like hemoglobin levels and blood group data).

2. User Personas (Mini Project 1 Alignment)

Persona 1: Amina Sani (The Antenatal Care Patient)

Age: 29 | Location: Kano, Nigeria

Goals: Easily book routine hematology checks (PCV, blood group, genotype) and receive quick digital updates without frequent hospital trips.

Pain Points: Confusing medical terminology, long queues at hospital phlebotomy labs, and language barriers when navigating complex diagnostic apps.

Preference: Clear voice or text guidance in Hausa or English to track her blood parameters safely.

Persona 2: Chinedu Okafor (The Sickle Cell Warrior / Chronic Care Coordinator)

Age: 32 | Location: Lagos, Nigeria

Goals: Maintain a digital record of regular hematology panel reports and quickly request crisis-monitoring blood work.

Pain Points: Misplaced physical lab result sheets and lack of quick-access layouts for urgent test history.

Preference: A fast, streamlined bento-style dashboard with quick buttons for "Hematology Panel" and "Past Lab Records."

3. Low-Fidelity Wireframes

Core Layout Structure:

Language & Profile Setup: Initial screen prompt for instant language choice (English | Hausa | Pidgin) before entering the portal.

Hematology Unit Dashboard: Specialized quick-action cards for "Book Blood Test" (FBC, Genotype, Lipid/Hematology panels), "View Blood Results," and "Transfusion History."

Test Selection & Booking Flow: Step-by-step progress indicator for choosing specific blood tests, selecting a certified laboratory branch, and picking a convenient time slot.

Key High-Fidelity Screens Designed:

1. Multilingual Toggle Screen: Seamless switcher affecting UI copy for the hematology home interface.

2. Hematology Service Hub: Clean cards showcasing available blood tests with clear pricing, preparation notes (e.g., fasting requirements), and turnaround times.

3. Result View Screen: Structured data visualization showing recent blood counts with safe range indicators.
