

LAFIYACONNECT: WEEK 2 USER RESEARCH & PROTOTYPING REPORT

Internship Track: UI/UX Design Practical Learning Track (Skill Set Go EduTech) Project Focus:
Multilingual Hematology Mobile Application (English, Nigerian Pidgin, Hausa)

1. User Research Summary

To ensure LafiyaConnect addresses real-world challenges in diagnostic healthcare, lightweight user research and contextual inquiries were conducted with target demographics (antenatal patients and chronic care family coordinators).

Target Audience Identified: Antenatal care patients requiring regular blood profile checks (e.g., Packed Cell Volume) and family members coordinating health records for relatives.

Key User Pain Points:

Language & Literacy Barriers: Many patients struggle to understand complex English medical terminology related to blood work (e.g., "Full Blood Count" or specific genotype profiles).

Queue Anxiety & Time Loss:Long physical queues at diagnostic labs cause immense stress for sick patients or busy caregivers.

Fragmented Result Tracking:Difficulty keeping track of previous test results over time, leading to repeated or lost tests.

Core Solutions Implemented:

Integration of an instant real-time language switcher supporting English, Nigerian Pidgin, and Hausa on all primary screens.

Streamlined 3-step digital booking to minimize friction and pre-schedule lab times.

2. Information Architecture (IA) & User Journey Map

The information architecture maps out how users navigate the application without cognitive overload, moving logically from onboarding to lab result management.

Information Architecture Hierarchy:-

- Onboarding & Authentication: Splash Screen -> Language Selector (EN / PI / HA) -> Login / Sign Up.
- Main Dashboard (Bento Grid Layout):
Quick Booking Shortcut (Hematology panels: FBC, PCV, Genotype).
- Active Appointments & Status tracker.
Recent Lab Results Repository.
Educational Health Tips.
- Booking Flow: Select Test Type -> Choose Lab Location -> Pick Date & Time Slot -> Review & Confirm Summary.
- Results & Profile: Digital Result View with download/share options -> User Settings & Language Preferences.

User Journey Stages

Discovery & Entry:User opens the app, instantly selects their preferred language (e.g., Hausa), and logs in.

Task Execution:User navigates the bento dashboard to book a Packed Cell Volume (PCV) test for antenatal care, selecting an available morning slot.

Completion & Relief:User receives a digital appointment slip with a QR code, eliminating long registration queues at the physical laboratory.

3. Interactive Figma Prototype Links & Navigation Flow

The low-fidelity wireframes from Week 1 were translated into high-fidelity interactive prototypes in Figma.

FigmaPrototypeLink:

[website?node-id=702-14985&t=he4KKCVzluguZaAU-1&scaling=scale-down&content-scaling=fixed&page-id=692%3A2024&starting-point-node-id=702%3A14985\]](https://www.figma.com/website?node-id=702-14985&t=he4KKCVzluguZaAU-1&scaling=scale-down&content-scaling=fixed&page-id=692%3A2024&starting-point-node-id=702%3A14985)

Prototyping Interactions Configured:

Tapping the language toggle dynamically shifts micro-copy across screens.

Clicking "Book Test" on the bento dashboard triggers smart animations into the 3-step booking sequence.

Interactive calendar component simulates active date and time-slot selection states.

4. Usability Testing Evidence & Iterations

A lightweight usability test was simulated with 3 representative users (evaluating navigation ease, comprehension of multilingual text, and booking speed).

Test Findings & Observations:

Observation 1:Users immediately recognized the language toggle pills at the top right of the screen, successfully switching between English and Nigerian Pidgin.

Observation 2:Some users initially missed the step-indicator progress bar during the booking phase.

Design Improvements Applied:

Increased contrast and padding on the booking step-indicator (Details -> Date & Time -> Confirm) to clearly guide the user forward.

Simplified medical jargon on result summary cards into plain language equivalents across all three supported languages.
